

## Digital Temperature Sensor with SPI™ Interface

### Features

- Temperature-to-Digital Converter
- SPI™ Compatible Interface
- 10-Bit Resolution (0.25°C/Bit)
- ±2°C (max.) Accuracy from -40°C to +85°C
- ±3°C (max.) Accuracy from -55°C to +125°C
- 2.65V to 5.5V Operating Range
- Low Power Consumption:
  - 250 µA (typ.) Continuous Temperature Conversion Mode
  - 1 µA (max.) Shutdown Mode
- Power Saving One-Shot Temperature Measurement
- Industry Standard 8-Pin MSOP Package
- Space Saving 8-Pin DFN (3x3 mm) Package

### Typical Applications

- Personal Computers and Servers
- Hard Disk Drives and Other PC Peripherals
- Entertainment Systems
- Office Equipment
- Datacom Equipment
- Mobile Phones
- General Purpose Temperature Monitoring

### Package Types

### General Description

The TC72 is a digital temperature sensor capable of reading temperatures from -55°C to +125°C. This sensor features a serial interface that allows communication with a host controller or other peripherals. The TC72 interface is compatible with the SPI protocol. The TC72 does not require any additional external components. However, it is recommended that a decoupling capacitor of 0.01 µF to 0.1 µF be provided between the V<sub>DD</sub> and GND pins.

The TC72 can be used either in a Continuous Temperature Conversion mode or a One-Shot Conversion mode. The Continuous Conversion mode measures the temperature approximately every 150 ms and stores the data in the temperature registers. In contrast, the One-Shot mode performs a single temperature measurement and returns to the power saving shutdown mode.

The TC72 features high temperature accuracy, ease-of-use and is the ideal solution for implementing thermal management in a variety of systems. The device is available in both 8-pin MSOP and 8-pin DFN space-saving packages. The TC72 also features a shutdown mode for low power operation.

## Typical Application

## 1.0 ELECTRICAL CHARACTERISTICS

### 1.1 Maximum Ratings†

$V_{DD}$ .....	6.0V
All inputs and outputs w.r.t. GND ...	-0.3V to $V_{DD}$ +0.3V
Storage temperature .....	-65°C to +150°C
Ambient temp. with power applied .....	-55°C to +125°C
Junction Temperature .....	150°C
ESD protection on all pins:	
Human Body Model (HBM).....	> 4 kV
Man Machine Model (MM).....	> 400V
Latch-Up Current at each pin .....	±200 mA
Maximum Power Dissipation.....	250 mW

† **Notice:** Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## PIN FUNCTION TABLE

Name	Function
NC	No Internal Connection
CE	Chip Enable Input, the device is selected when this input is high
SCK	Serial Clock Input
GND	Ground
SDO	Serial Data Output
SDI	Serial Data Input
NC	No Internal Connection
$V_{DD}$	Power Supply

## DC CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, all parameters apply at $V_{DD} = 2.65V$ to $5.5V$ , $T_A = -55^\circ C$ to $+125^\circ C$ .						
Parameters	Sym	Min	Typ	Max	Units	Conditions
<b>Power Supply</b>						
Operating Voltage Range	$V_{DD}$	2.65	—	5.5	V	<b>Note 1</b>
Operating Current: Normal Mode, ADC Active	$I_{DD-CON}$	—	250	400	$\mu A$	Continuous temp. conversion mode (Shutdown Bit = '0')
Shut-Down Supply Current	$I_{SHD}$	—	0.1	1.0	$\mu A$	Shutdown Mode (Shutdown Bit = '1')
<b>Temperature Sensor and Analog-to-Digital Converter</b>						
Temperature Accuracy ( <b>Note 1</b> )	$T_{ACY}$	-2.0	—	+2.0	$^\circ C$	$-40^\circ C < T_A < +85^\circ C$
		-3.0	—	+3.0		$-55^\circ C < T_A < +125^\circ C$
Resolution		—	10	—	Bits	<b>Note 4</b>
ADC Conversion Time	$t_{CONV}$	—	150	200	ms	
<b>Digital Input / Output</b>						
High Level Input Voltage	$V_{IH}$	$0.7 V_{DD}$	—	—	V	
Low Level Input Voltage	$V_{IL}$	—	—	$0.2 V_{DD}$	V	
High Level Output Voltage	$V_{OH}$	$0.7 V_{DD}$	—	—	V	$I_{OH} = 1\text{ mA}$
Low Level Output Voltage	$V_{OL}$	—	—	$0.2 V_{DD}$	V	$I_{OL} = 4\text{ mA}$
Input Resistance	$R_{IN}$	1.0	—	—	$M\Omega$	
Pin Capacitance	$C_{IN}$	—	15	—	$pF$	
	$C_{OUT}$	—	50	—		

**Note 1:** The TC72-2.8MXX, TC72-3.3MXX and TC72-5.0MXX will operate from a supply voltage of 2.65V to 5.5V. However, the TC72-2.8MXX, TC72-3.3MXX and TC72-5.0MXX are tested and specified at the nominal operating voltages of 2.8V, 3.3V and 5.0V respectively. As  $V_{DD}$  varies from the nominal operating value, the accuracy may be degraded. Refer to Figure 2-5 and Figure 2-6.

**2:** Measured with a load of  $C_L = 50\text{ pF}$  on the SDO output pin of the TC72.

**3:** All time measurements are measured with respect to the 50% point of the signal, except for the SCK rise and fall times. The rise and fall times are defined as the 10% to 90% transition time.

**4:** Resolution = Temperature Range/No. of Bits =  $(+127^\circ C - -128^\circ C) / (2^{10}) = 256/1024 = 0.25^\circ C/Bit$

SCK to Data Hold Time	$t_{CDH}$	35	—	—	ns	
Data to SCK Set-up Time	$t_{DC}$	35	—	—	ns	
SCK to CE Hold Time	$t_{CCH}$	100	—	—	ns	
SCK Rise Time	$t_R$	—	—	200	ns	
SCK Fall Time	$t_F$	—	—	200	ns	
CE Inactive Time	$t_{CWH}$	400	—	—	ns	
<b>Thermal Package Resistance</b>						
Thermal Resistance, MSOP-8	$\theta_{JA}$	—	206	—	$^{\circ}C/W$	
Thermal Resistance, DFN-8	$\theta_{JA}$	—	60.5	—	$^{\circ}C/W$	

- Note 1:** The TC72-2.8MXX, TC72-3.3MXX and TC72-5.0MXX will operate from a supply voltage of 2.65V to 5.5V. However, the TC72-2.8MXX, TC72-3.3MXX and TC72-5.0MXX are tested and specified at the nominal operating voltages of 2.8V, 3.3V and 5.0V respectively. As  $V_{DD}$  varies from the nominal operating value, the accuracy may be degraded. Refer to Figure 2-5 and Figure 2-6.
- Note 2:** Measured with a load of  $C_L = 50$  pF on the SDO output pin of the TC72.
- Note 3:** All time measurements are measured with respect to the 50% point of the signal, except for the SCK rise and fall times. The rise and fall times are defined as the 10% to 90% transition time.
- Note 4:** Resolution = Temperature Range/No. of Bits =  $(+127^{\circ}C - -128^{\circ}C) / (2^{10}) = 256/1024 = 0.25^{\circ}C/Bit$

## SPI READ DATA TRANSFER

(CP = 0, data shifted on rising edge of SCK, data clocked on falling edge of SCK, A7 = 0)

## SPI WRITE DATA TRANSFER

(CP = 0, data shifted on rising edge of SCK, data clocked on falling edge of SCK, A7 = 1)

**Note:** The timing diagram is drawn with CP = 0. The TC72 also functions with CP = 1; however, the edges of SCK are reversed as defined in Table 3-3 and Figure 3-2.

**FIGURE 1-1:** Serial Port Timing Diagrams.

**FIGURE 2-12:** Histogram of Temperature Accuracy at  $+125$  Degrees C.

# TC72

## 3.0 FUNCTIONAL DESCRIPTION

The TC72 consists of a band-gap type temperature sensor, a 10-bit Sigma Delta Analog-to-Digital Converter (ADC), an internal conversion oscillator and a double buffer digital output port. The 10-bit ADC is scaled from  $-128^{\circ}\text{C}$  to  $+127^{\circ}\text{C}$ ; therefore, the resolution is  $0.25^{\circ}\text{C}$  per bit. The ambient temperature operating range of the TC72 is specified from  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

This device features a four-wire serial interface that is fully compatible with the SPI specification and, therefore, allows simple communications with common microcontrollers and processors. The TC72 can be used either in a Continuous Temperature Conversion mode or a One-Shot Conversion mode. The TC72 temperature measurements are performed in the background and, therefore, reading the temperature via the serial I/O lines does not affect the measurement in progress.

The Continuous Conversion mode measures the temperature approximately every 150 ms and stores the data in the temperature registers. The TC72 has an internal clock generator that controls the automatic temperature conversion sequence. The automatic temperature sampling operation is repeated indefinitely until the TC72 is placed in a shutdown mode by a write operation to the Control register. The TC72 will remain in the shutdown mode until the shutdown bit in the Control register is reset.

In contrast, the One-Shot mode performs a single temperature measurement and returns to the power-saving shut down mode. This mode is especially useful for low power applications.

**FIGURE 3-1:** Temperature-To-Digital Transfer Function (Non-linear Scale).

## 3.1 Temperature Data Format

Temperature data is represented by a 10-bit two's complement word with a resolution of 0.25°C per bit. The temperature data is stored in the Temperature registers in a two's complement format. The ADC converter is scaled from -128°C to +127°C, but the operating range of the TC72 is specified from -55°C to +125°C.

### Example:

Temperature = 41.5°C

MSB Temperature Register = 00101001b  
 =  $2^5 + 2^3 + 2^0$   
 = 32 + 8 + 1 = 41

LSB Temperature Register = 10000000b =  $2^{-1}$  = 0.5

**TABLE 3-1: TC72 TEMPERATURE OUTPUT DATA**

Temperature	Binary MSB / LSB	Hex
+125°C	0111 1101/0000 0000	7D00
+25°C	0001 1001/0000 0000	1900
+0.5°C	0000 0000/1000 0000	0080
+0.25°C	0000 0000/0100 0000	0040
0°C	0000 0000/0000 0000	0000
-0.25°C	1111 1111/1100 0000	FFC0

2 <sup>-1</sup>	2 <sup>-2</sup>	0	0	0	0	0	0	01H Temp. LSB

## 3.2 Power-Up And Power-Down

The TC72 is in the low power consumption shutdown mode at power-up. The Continuous Temperature Conversion mode is selected by performing a Write operation to the Control register, as described in Section 4.0, "Internal Register Structure".

A supply voltage lower than 1.6V (typical) is considered a power-down state for the TC72. If the supply voltage drops below the 1.6V threshold, the internal registers are reset to the power-up default state.

## 3.3 Serial Bus Interface

The serial interface consists of the Chip Enable (CE), Serial Clock (SCK), Serial Data Input (SDI) and Serial Data Output (SDO) signals. The TC72 operates as a slave and is compatible with the SPI bus specifications. The serial interface is designed to be compatible with the Microchip PICmicro<sup>®</sup> family of microcontrollers.

The CE input is used to select the TC72 when multiple devices are connected to the serial clock and data lines. The CE is active-high, and data is written to or read from the device, when CE is equal to a logic high voltage. The SCK input is disabled when CE is low. The rising edge of the CE line initiates a read or write operation, while the falling edge of CE completes a read or write operation.

The SCK input is provided by the external microcontroller and is used to synchronize the data on the SDI and SDO lines. The SDI input writes data into the TC72's Control register, while the SDO outputs the temperature data from the Temperature register and the status of Shutdown bit of the Control register.

The TC72 has the capability to function with either an active-high or low SCK input. The SCK inactive state is detected when the CE signal goes high, while the polarity of the clock input (CP) determines whether the data is clocked and shifted on either the rising or falling edge of the system clock, as shown in Figure 3-2. Table 3-3 gives the appropriate clock edge used to transfer data into and out of the registers. Each data bit is transferred at each clock pulse, and the data bits are clocked in groups of eight bits, as shown in Figure 3-3.

The address byte is transferred first, followed by the data. A7, the MSb of the address, determines whether a read or write operation will occur. If A7 = '0', one or more read cycles will occur; otherwise, if A7 = '1', one or more write cycles will occur.

Data can be transferred either in a single byte or a multi-byte packet, as shown in Figure 3-3. In the 3-byte packet, the data sequence consists of the MSb temperature data, LSb temperature data, followed by the Control register data. The multi-byte read feature is initiated by writing the highest address of the desired packet to registers. The TC72 will automatically send the register addressed and all of the lower address registers, as long as the Chip Enable pin is held active.

**TABLE 3-3: OPERATIONAL MODES**

Mode	CE	SCK (Note 1)	SDI	SDO
Disable	L	Input Disabled	Input Disabled	High Z
Write (A7 = 1)	H	CP=1, Data Shifted on Falling Edge, Data Clocked on Rising Edge	Data Bit Latch	High Z
		CP=0, Data Shifted on Rising Edge, Data Clocked on Falling Edge		
Read (A7 = 0)	H	CP=1, Data Shifted on Falling Edge, Data Clocked on Rising Edge	X	Next data bit shift, <b>Note 2</b>
		CP=0, Data Shifted on Rising Edge, Data Clocked on Falling Edge		

- Note 1:** CP is the Clock Polarity of the microcontroller system clock. If the inactive state of SCK is logic level high, CP is equal to '1'; otherwise, if the inactive state of SCK is low, CP is equal to '0'.
- Note 2:** During a Read operation, SDO remains at a high impedance (High Z) level until the eight bits of data begin to be shifted out of the Temperature register.

### 3.4 Read Operation

The temperature and control register data is outputted from the TC72 using the CE, SCK and SDO lines. Figure 3-3 shows a timing diagram of the read operation. Communication is initiated by the chip enable (CE) going high. The SDO line remains at the voltage level of the LSb bit that is outputted and goes to the tri-state level when the CE line goes to a logic low level.

### 3.5 Write Operation

Data is clocked into the Control register in order to enable the TC72's power saving shutdown mode. The write operation is shown in Figure 3-3 and is accomplished using the CE, SCK and SDI line.

**FIGURE 3-2:** Serial Clock Polarity (CP) Operation.

**FIGURE 3-3:** Serial Interface Timing Diagrams (CP=0).

## 4.0 INTERNAL REGISTER STRUCTURE

The TC72 registers are listed below.

**TABLE 4-1: REGISTERS FOR TC72**

Register	Read Address	Write Address	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR/BOR
Control	00hex	80hex	0	0	0	One-Shot (OS)	0	1	0	Shutdown (SHDN)	05hex
LSB Temperature	01hex	N/A	T1	T0	0	0	0	0	0	0	00hex
MSB Temperature	02hex	N/A	T9	T8	T7	T6	T5	T4	T3	T2	00hex
Manufacturer ID	03hex	N/A	0	1	0	1	0	1	0	0	54hex

### 4.1 Control Register

The Control register is both a read and a write register that is used to select either the Shutdown, Continuous or One-Shot Conversion operating mode. The Temperature Conversion mode selection logic is shown in Table 4-2. The Shutdown (SHDN) bit is stored in bit 0 of the Control register. If SHDN is equal to '1', the TC72 will go into the power-saving shutdown mode. If SHDN is equal to '0', the TC72 will perform a temperature conversion approximately every 150 ms.

At power-up, the SHDN bit is set to '1'. Thus, the TC72 is in the shutdown operating mode at startup. The Continuous Temperature Conversion mode is selected by writing a '0' to the SHDN bit of the Control register.

The Shutdown mode can be used to minimize the power consumption of the TC72 when active temperature monitoring is not required. The shutdown mode disables the temperature conversion circuitry; however, the serial I/O communication port remains active. A temperature conversion will be initialized by a Write operation to the Control register to select either the Continuous Temperature Conversion or the One-Shot operating mode. The temperature data will be available in the MSB and LSB Temperature registers approximately 150 ms after the Control register Write operation.

The One-Shot mode is selected by writing a '1' into bit 4 of the Control register. The One-Shot mode performs a single temperature measurement and returns to the power-saving shutdown mode. After completion of the temperature conversion, the One-Shot bit (OS) is reset to '0' (i.e. "OFF"). The user must set the One-Shot bit to '1' to initiate another temperature conversion.

Bits 1, 3, 5, 6 and 7 of the Control register are not used by the TC72. Bit 2 is set to a logic '1'. Any write operation to these bit locations will have no effect on the operation of the TC72.

### 4.2 Temperature Register

The Temperature register is a read-only register and contains a 10-bit two's complement representation of the temperature measurement. Bit 0 through Bit 5 of the LSB Temperature register are always set to a logic '0'.

At Power-On Reset (POR) or a Brown-Out Reset (BOR) low voltage occurrence, the temperature register is reset to all zeroes, which corresponds to a temperature value of 0°C. A  $V_{DD}$  power supply less than 1.6V is considered a reset event and will reset the Temperature register to the power-up state.

### 4.3 Manufacturer ID Register

The Manufacturer Identification (ID) register is a read-only register used to identify the temperature sensor as a Microchip component.

**TABLE 4-2: CONTROL REGISTER TEMPERATURE CONVERSION MODE SELECTION**

Operational Mode	One-Shot (OS) Bit 4	Shutdown (SHDN) Bit 0
Continuous Temperature Conversion	0	0
Shutdown	0	1
Continuous Temperature Conversion (One-Shot Command is ignored if SHDN = '0')	1	0
One-Shot	1	1

---

## 5.0 APPLICATIONS INFORMATION

The TC72 does not require any additional components in order to measure temperature; however, it is recommended that a decoupling capacitor of 0.1mF to 1mF be provided between the  $V_{DD}$  and GND pins. Although the current consumption of the TC72 is modest (250 mA, typical), the TC72 contains an on chip data acquisition with internal digital switching circuitry. Thus, it is considered good design practice to use an external decoupling capacitor with the sensor. A high frequency ceramic capacitor should be used and be located as close as possible to the IC power pins in order to provide effective noise protection to the TC72.

The TC72 measures temperature by monitoring the voltage of a diode located on the IC die. The IC pins of the TC72 provide a low impedance thermal path between the die and the PCB, allowing the TC72 to effectively monitor the temperature of the PCB board. The thermal path between the ambient air is not as efficient because the plastic IC housing package functions as a thermal insulator. Thus the ambient air temperature (assuming that a large temperature gradient exists between the air and PCB) has only a small effect on the temperature measured by the TC72.

Note that the exposed metal center pad on the bottom of the DFN package is connected to the silicon substrate. The center pad should be connected to either the PCB ground plane or treated as a “No Connect” pin. The mechanical dimensions of the center pad are given in Section 6.0, “Packaging Information”, of this datasheet.

A potential for self-heating errors can exist if the TC72 SPI communication lines are heavily loaded. Typically, the self-heating error is negligible because of the relatively small current consumption of the TC72. A temperature accuracy error of approximately 0.5°C will result from self-heating if the SPI communication pins sink/source the maximum current specified for the TC72. Thus to maximize the temperature accuracy, the output loading of the SPI signals should be minimized.

## 6.0 PACKAGING INFORMATION

### 6.1 Taping Form

Tape and Reel information for the 8-Lead DFN package will be available TBD.

## 6.2 Package Marking Information

8-Lead MSOP

Example:

8-Lead DFN

Example:

<b>Legend:</b>	XX...X	Customer specific information*
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
<b>Note:</b>	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.	

\* Standard OTP marking consists of Microchip part number, year code, week code, and traceability code.

## ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape® or Microsoft® Internet Explorer. Files are also available for FTP download from our FTP site.

### Connecting to the Microchip Internet Web Site

The Microchip web site is available at the following URL:

**[www.microchip.com](http://www.microchip.com)**

The file transfer site is available by using an FTP service to connect to:

**<ftp://ftp.microchip.com>**

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

## SYSTEMS INFORMATION AND UPGRADE HOT LINE

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive the most current upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-480-792-7302 for the rest of the world.

092002

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>		<u>-X</u>	<u>X</u>	<u>XX</u>
Device	Voltage Range	Temperature Range	Package	
Device:	TC72:	Digital Temperature Sensor w/SPI Interface		
Voltage Range:	2.8	= Accuracy Optimized for 2.8V		
	3.3	= Accuracy Optimized for 3.3V		
	5.0	= Accuracy Optimized for 5.0V		
Temperature Range:	M	= -55°C to +125°C		
Package:	MF	= Dual, Flat, No Lead (DFN) (3x3mm), 8-lead		
	MFTR	= Dual, Flat, No Lead (DFN) (3x3mm), 8-lead (Tape and Reel)		
	UA	= Plastic Micro Small Outline (MSOP), 8-lead		
	UATR	= Plastic Micro Small Outline (MSOP), 8-lead (Tape and Reel)		

**Examples:**

- a) TC72-2.8MUA: Digital Temperature Sensor, 2.8V, 8LD MSOP package.
- b) TC72-2.8MUATR: Digital Temperature Sensor, 2.8V, 8LD MSOP (tape and reel) package.
- c) TC72-2.8MMF: Digital Temperature Sensor, 2.8V, 8LD DFN package.
- d) TC72-3.3MUA: Digital Temperature Sensor, 3.3V, 8LD MSOP package.
- e) TC72-3.3MMF: Digital Temperature Sensor, 3.3V, 8LD DFN package.
- f) TC72-5.0MUA: Digital Temperature Sensor, 5.0V, 8LD MSOP package.
- g) TC72-5.0MMF: Digital Temperature Sensor, 5.0V, 8LD DFN package.
- h) TC72-5.0MMFTR: Digital Temperature Sensor, 5.0V, 8LD DFN (tape and reel) package.

## Sales and Support

### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### New Customer Notification System

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.
