## 1. Overview of OV5640 Application

OV5640 is a 1/4 inch high performance 5M camera supporting both DVP and MIPI interface. This document focus on DVP interface application of OV5640. For MIPI interface application of OV5640, please read “OV5640 Camera Module Application Notes (with MIPI interface)”

OV5640 could be used as

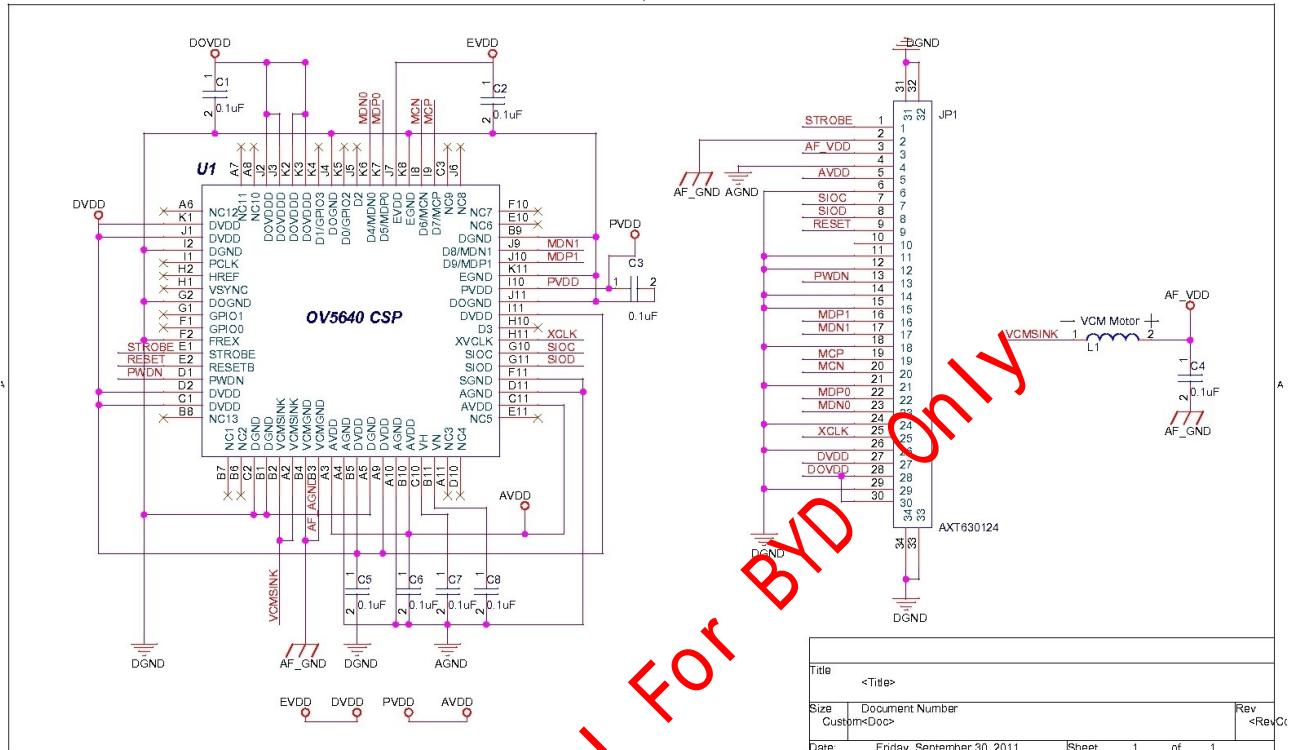

5M Main Camera for Cellular Phone Applications

5M Main Camera for Tablet Applications

Confidential For BYD Only

## 2. Hardware Design

### 2.1 OV5640 Camera Module Reference Design

Note:

1. PWND, active HIGH as DOVDD to power down OV5640, should be connected to ground outside of module if unused
2. RESETB. Active LOW to reset OV5640, should be connected to DOVDD outside of module if unused
3. AVDD is 2.6-3.0V of sensor analog power (clean). 2.8V is recommended. AVDD must be 2.5V+5% for OTP write, and OTP read does not have such requirement
4. DVDD is  $1.5V \pm 5\%$  of sensor digital power(clean). Using the internal DVDD regulator is strongly recommended
5. DOVDD. 1.8V recommended is 1.7V-3.0V of sensor digital IO power(clean)
6. sensor AGND and DGND should be separated and connected to a single point outside PCB, Do not connect inside module
7. Capacitors should be close to the related sensor pins
8. MCP, MCN, MDP0 and MDP1 are 1 lane MIPI interface. MCP, MCN, MDP0, MDN0, MDP1 and MCP1 are 2 lane MIPI interface.

## 2.2 Host Interface

### 2.1.1 Pin Definition

The video port of OV5640 support 2 lane MIPI and 1 lane MIPI. MCP, MCN, MDP0 and MDP1 are 1 lane MIPI interface. MCP, MCN, MDP0, MDN0, MDP1 and MCP1 are 2 lane MIPI interface.

The Href and Hsync signal is on the same pin – Href. The function of this pin could be selected by SCCB setting.

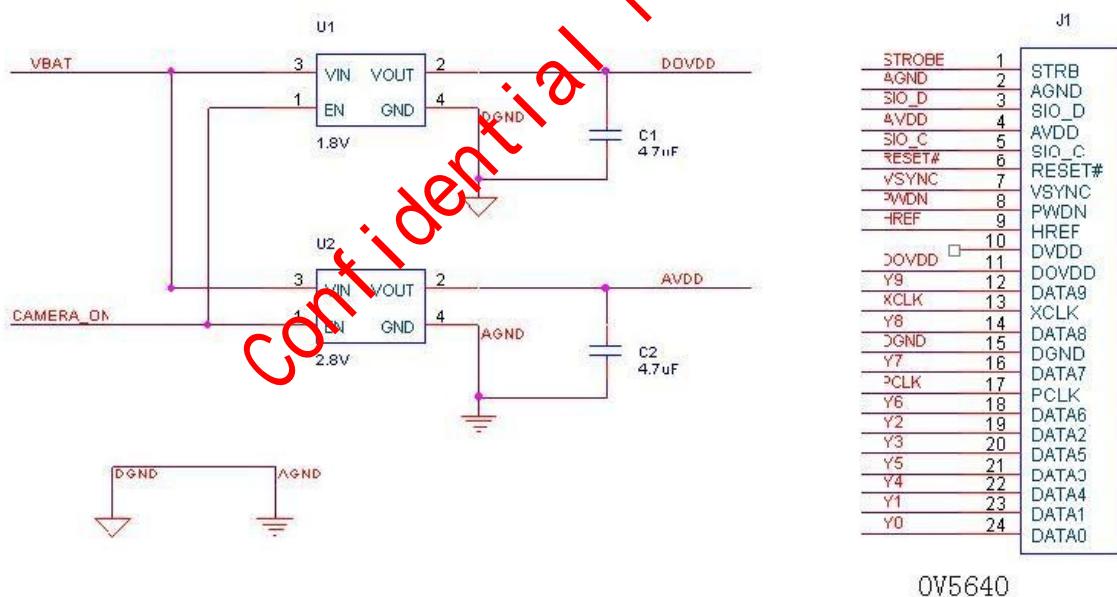

The SIO\_C and SIO\_D bus should have external pull up resistors, the typical value of the pull up resistors is 5.1K.

RESET# is active low with internal pull-up resistor. Reset# should be controlled by backend chip for proper power up sequence.

PWDN is active high with internal pull-down resistor. PWDN should be controlled by backend chip for proper power up sequence.

## 2.2 Power Supply

When OV5640 is used with back-end chip supporting MIPI interface, DOVDD of OV5650 should be 1.8V. DVDD is generated by internal regulator of OV5640. So 2 regulators should be used to supply powers to OV5640.

## 2.3 Deal with Lens

### 2.3.1 Light fall off

Light fall off means the corner of image is darker than center of image. It is caused by the lens. The lens shading correction function of OV5640 could be turned on to compensate the corner brightness and make the whole picture looks same bright.

### 2.3.2 Dark corner

Some lens may have dark corner. Dark corner means the color of picture looks almost black. It is not possible to correct dark corner with lens correction. So the module with dark corner is NG, it can not be used.

### 2.3.3 Resolution

The resolution of camera module depends on lens design, focus adjustment and sensor resolution as well. The focus adjustment is very important for camera module assembly.

### 2.3.4 Optical contrast

The optical contrast of lens is very important to picture quality. If the optical contrast of lens is not good, the picture would look foggy. Though it could be improved by increase the sensor contrast to make the picture sharper, the higher sensor contrast would make the detail lost of dark area of the picture.

### 2.3.5 Lens Cover

The lens cover is the cheapest part in optical path. But it could affect picture quality very much. The lens cover should be made with optical glass with AR coating at both side. Otherwise, the lens cover may cause sensitivity loss and/or stronger lens flare.

### 2.3.6 Lens Correction

Lens Correction setting should be tuned for every module. Please find lens correction settings of modules tuned by OVT FAE.

#### 2.3.6.1 Lens Correction:

#### 2.3.6.2 Lens Correction:

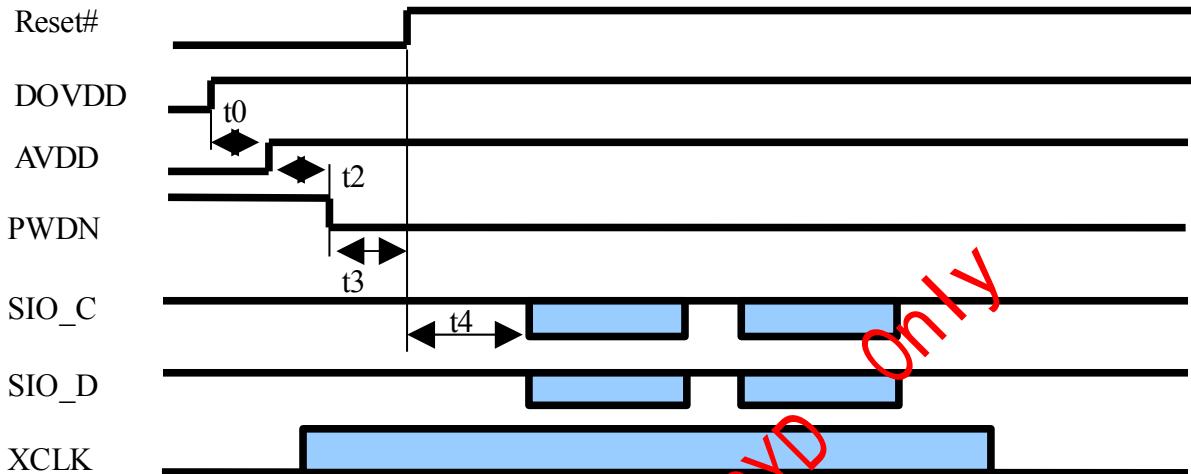

Note:

If module/lens you are using can not be found above, please contact with OmniVision local FAE for lens correction settings.

## 3. Hardware Operation

### 3.1 Operation Modes

#### 3.1.1 Power Up

t0:  $\geq 0$ ms. Delay from DOVDD stable to AVDD stable.

t2:  $\geq 5$ ms. Delay from AVDD stable to sensor power up stable.

t3:  $\geq 1$ ms. Delay from sensor power up stable to Reset# pull high.

t4:  $\geq 20$ ms. Delay from Reset pull high to SCCB initialization.

Step 1:

Reset# is applied to OV5640 camera module. PWDN is pulled high.

Step 2:

DOVDD and AVDD powers are applied. The 2 powers could be applied simultaneously. If applied separately, the power on sequence should be DOVDD first, and AVDD last.

Step 3:

after 5ms of AVDD reaching stable, pull PWDN to low.

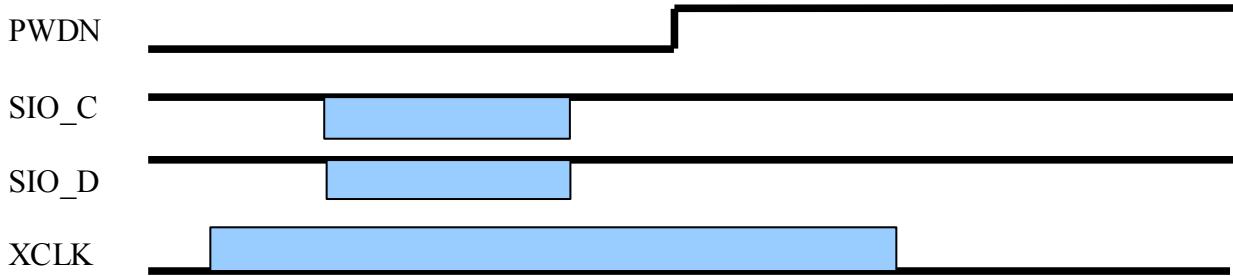

Step 4:

after 1ms of PWDN go low, pull high Reset#.

Step 5:

After 20ms, initialize OV5640 by SCCB initialization. Please find the settings from section ?-?.

### 3.1.2 Power Down

Step 1:  
Pull PWDN pin high.

Step 2:  
Pull XCLK low. XCLK should be kept more than 0.1ms after PWDN pulled high.

### 3.1.3 Wake up from Power down

Step 1:  
Apply XCLK

Step 2:  
after 0.1ms, Pull low PWDN

Optional Step 3:  
Full SCCB Initialization. Please find the settings from section ?-?.

### 3.1.4 Power OFF

Step 1.  
Pull low XCLK,

Step 2.  
Turn off AVDD, DVDD and DOVDD. The 3 powers could be turned off simultaneously. If turned off separately, DVDD should be turned off first, AVDD second and DOVDD third.

Step 3.

Pull Low PWDN and RESET

### 3.1.5 Hardware Reset

OV5640 sensor includes a RESETB pin that forces a complete hardware reset when it is pulled low(GND). OV5640 clears all registers and resets them to their default values when a hardware reset occurred. A reset can also be initiated through the SCCB interface by setting register 0x12[7] to high.

The whole chip will be reset during power up. Manually applying a hard reset after power up is recommended even through the on-chip power up reset is included. The hard reset is active low with an asynchronous design. The reset pulse width should be greater than or equal to 1ms.

## 3.2 Operations

### 3.2.1 Cut of power when not used

Mode	Operation
Battery On	No
Enter Camera	Power On Hardware Reset Initialization
Exit Camera	Power Off

### 3.2.2 Power down when not used

Mode	
Battery On	Power Up Hardware Reset Power Down
Enter Camera	Wake up from Power Down Initialization
Exit From Camera	Power Down

### 3.2.3 OV5640 share I<sup>2</sup>C bus with other devices

States other devices access I <sup>2</sup> C	States other devices can not access I <sup>2</sup> C
Power Off, Power Down, Wake up from Power Down Power up	None

## 4. Software Operation

### 4.1 1 Lane MIPI Interface

#### 4.1.1 YCbCr Initial Setting

write_i2c(0x460c, 0x22); // VFIFO, PCLK manual  
write_i2c(0x4837, 0x0a); // MIPI global timing  
write_i2c(0x3824, 0x01); // PCLK divider  
write_i2c(0x5001, 0x83); // SDE on, scale off, UV average off, CMX on, AWB on
```

### 4.3 MIPI Stream Control

#### 4.3.1 MIPI Stream on

```
write_i2c(0x4202, 0x00);
```

#### 4.3.2 MIPI Stream off

```
write_i2c(0x4202, 0x0f);
```

### 4.4 YUV Sequence

The YUV sequence of OV5640 output image should match with baseband chip/ISP to get correct image.

0x4300[0:1] control YUV sequence

//Y U Y V

```
write_i2c(0x4300, 0x30);
```

//Y V Y U

```
write_i2c(0x4300, 0x31);
```

//V Y U Y

```
write_i2c(0x4300, 0x33);
```

//U Y V Y

```
write_i2c(0x4300, 0x32);
```

## 4.5 Mirror and Flip

Since OV5640 is a BSI sensor, the light go to sensor from backside of sensor. So the image without mirror/flip looks mirror. The image with mirror looks normal.

```
i2c_salve_Address = 0x78;
```

MIRROR (default)

```
reg3820 = read_i2c(0x3820);
reg3820 = reg3820 & 0xf9; // flip off
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 | 0x06; // mirror on
write_i2c(0x3821, reg3821);
```

FLIP

```
reg3820 = read_i2c(0x3820);
reg3820 = reg3820 | 0x06; // flip on
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 & 0xf9; // mirror off
write_i2c(0x3821, reg3821);
```

MIRROR&FLIP

```
reg3820 = read_i2c(0x3820);
reg3820 = reg3820 | 0x06; // flip on
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 | 0x06; // mirror on
write_i2c(0x3821, reg3821)
```

Normal

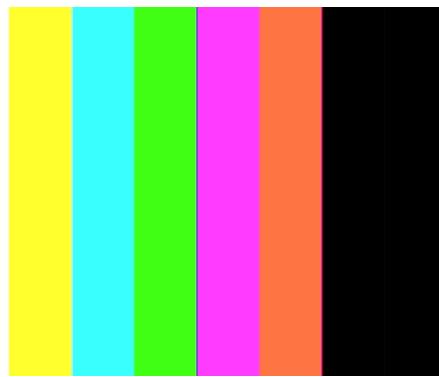

```
reg3820 = read_i2c(0x3820);
reg3820 = reg3820 & 0xf9; // flip off
write_i2c(0x3820, reg3820);
reg3821 = read_i2c(0x3821);
reg3821 = reg3821 & 0xf9; // mirror off
write_i2c(0x3821, reg3821);
```

## 4.6 Test Pattern

Color bar

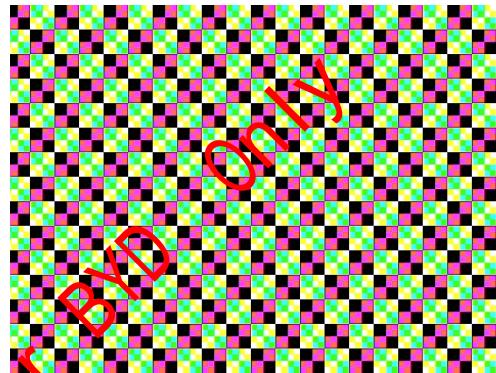

```
write_i2c(0x503d, 0x80);
write_i2c(0x4741, 0x00);
```

Color bar

Color square

```
write_i2c(0x503d, 0x82);
write_i2c(0x4741, 0x0);
```

Color square

## 4.7 Remove Light Band

OV5640\_set\_bandingfilter() function set banding filters automatically in camera driver.

Light band is removed by set exposure to  $\frac{n}{100}$  ( $\frac{n}{120}$  for 60Hz) seconds. The banding filter value tell OV5640 how many lines is  $\frac{n}{100}$  ( $\frac{n}{120}$  for 60Hz) seconds.

$$\text{Banding\_filter\_50hz} = \frac{\frac{1}{100}}{\text{line\_period}} = \frac{\frac{1}{100}}{\text{HTS} \times \text{sysclk}} = \frac{\text{sysclk}}{\text{HTS} \times 100}$$

$$\text{Banding\_filter\_60hz} = \frac{\frac{1}{120}}{\text{line\_period}} = \frac{\frac{1}{120}}{\text{HTS} \times \text{sysclk}} = \frac{\text{sysclk}}{\text{HTS} \times 120}$$

HTS = register {0x380c, 0x380d}

sysclk could be calculated by the function OV5640\_get\_sysclk().

## 4.8 User Interface Functions

### 4.8.1 Brightness

Brightness +4

```
write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x5587, 0x40);

write_i2c(0x3212, 0xa3); // launch group 3
```

**Greenish**

```
write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x5580, 0x1e);
write_i2c(0x5583, 0x60);
write_i2c(0x5584, 0x60);
write_i2c(0x5003, 0x08);
write_i2c(0x3212, 0x13); // end group 3
write_i2c(0x3212, 0xa3); // launch group 3
```

**Overexposure**

```
write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x5580, 0x1e);
write_i2c(0x5583, 0xf0);
write_i2c(0x5584, 0xf0);
write_i2c(0x5003, 0x08);
write_i2c(0x3212, 0x13); // end group 3
write_i2c(0x3212, 0xa3); // launch group 3
```

```
Solarize
write_i2c(0x3212, 0x03); // start group 3
write_i2c(0x5580, 0x06);
write_i2c(0x5583, 0x40); // sat U
write_i2c(0x5584, 0x10); // sat V
write_i2c(0x5003, 0x09);
write_i2c(0x3212, 0x13); // end group 3
write_i2c(0x3212, 0xa3); // launch group 3
```

#### 4.8.7 Night Mode

When night mode is turned on, dummy lines are inserted automatically and the frame rate is decreased. The total dummy line inserted is controlled by register 0x3a02, 0x3a03 for 50hz light and 0x3a14, 0x3a15 for 60hz light. The night mode on/off switch is controlled by register 0x3a00 bit[2].

##### Night Mode On

```
temp = read_i2c(0x3a00);
temp = temp | 0x04;
write_i2c(0x3a00, temp);
```

##### Night Mode Off

```
temp = read_i2c(0x3a00);
temp = temp & 0xfb;
write_i2c(0x3a00, temp);
```

#### 4.8.8 Banding Filter Selection

The camera driver of OV5640 supports banding filter calculation. So there is no need to set banding filter manually. There are 4 options for banding filter, they are

##### Off

```
temp = read_i2c(0x3a00);
temp = temp & 0xdff; // turn off banding filter
write_i2c(0x3a00, temp);
```

##### Manual 50Hz

```
write_i2c(0x3c00, 04); // set to 50Hz
write_i2c(0x3c01, 80); // manual banding filter
temp = read_i2c(0x3a00);
temp = temp | 0x20; // turn on banding filter
write_i2c(0x3a00, temp);
```

##### Manual 60Hz

```
write_i2c(0x3c00, 00); // set to 60Hz
write_i2c(0x3c01, 80); // manual banding filter
temp = read_i2c(0x3a00);
```

```
temp = temp | 0x20;      // turn on banding filter
write_i2c(0x3a00, temp);
```

### Auto Detection

```
write_i2c(0x3c01, 00);    // auto banding filter
temp = read_i2c(0x3a00);
temp = temp & 0xdf;      // turn off banding filter
write_i2c(0x3a00, temp);
```

The auto detection function depends on input clock. If input clock is not 24Mhz, please contact with OmniVision local FAE for setting update.

## 4.9 Auto Focus

### 4.9.1 Embedded Auto Focus Solution

The auto focus function of OV5640 is controlled by built-in micro-controller, and the AF driver is also built in OV5640 sensor. The firmware of micro-controller is downloaded from host. After firmware is running, the built-in micro-controller of OV5640 read auto focus information from sensor, calculate the focus position and driver VCM to the position. The host controls the function of built-in micro-controller by I2C commands.

### 4.9.2 I2C Commands for Auto Focus

Register name	Address	Description	Value
CMD_MAIN	0x3022	Auto focus main command register	0x03 - Trig Single Auto Focus 0x06 - Pause Auto Focus 0x08 - Release Focus 0x12 - Re-launch Focus Zones 0x00 – command is finished
CMD_ACK	0x3023	ACK of command	0x00 - Command is finished 0x01 - Command is running
FW_STATUS	0x3029	Status of focus	0x7F - S_FIRWARE Firmware is downloaded and not run. Cause 1 MCU is off Cause 2 Firmware is not correct. 0x7E - S_STARTUP Firmware is initializing. 0x70 - S_IDLEIdle state, focus is released. lens is located at the furthest position. 0x00 - S_FOCUSING Auto Focus is running. 0x10 S_FOCUSED Auto Focus is completed.

Note: The MCU will auto clear CMD\_MAIN to zero after the command is receipt, and auto clear CMD\_ACK to zero when the command is completed.

#### 4.9.3 AF Sequence

There are registers read and written by using OV5640 auto focus firmware sequence,

The auto focus steps as below:

1. Download firmware  
when enter preview for the first time
2. Auto focus  
when capture
3. Release focus  
when finished capture and return to preview

#### 4.9.4 Download firmware

After initial OV5640, the AF firmware can be download. It is same as download the initial setting. To speedup firmware download, I2c multiple bytes write is highly recommended.

After download the firmware, please check the registers below:

MCU on: 0x3000 BIT6=0 BIT5=0 0x3004 BIT6=1 BIT5=1

AFC on : 0x3001 BIT6=0 0x3005 BIT6=1

#### 4.9.5 Auto focus

Auto focus should be completed before capture sequence started.

1. Write 0x03 to register 0x3022 to start single focus
2. read back register 0x3029, if the read back value is 0x10, then focus is finished.
3. Write 0x06 to register 0x3022 to pause auto focus. Lens will stay in current focus position.

#### 4.9.6 Release Focus

After capture , Write 0x08 to register 0x3022 to release the position of lens, let the lens move back infinite.

### 4.10 Capture Sequence

#### 4.10.1 Shutter

The shutter of OV5640 controls exposure time. The unit of shutter is line period. Shutter value has limitation for each resolution. The maximum shutter value is VTS(0x380e, 0x380f) - 4.

Shutter register value is 16 multiple exposure lines. The shutter value are stored in 3 registers, reg0x3500, reg0x3501, reg3502 .

Shutter = (reg0x3500<<12) + (reg0x3501<<4) + (reg3502>>4);

#### 4.10.2 Gain

Gain is stored in reg0x350a and Reg0x350b.

Gain = ((reg0x350a & 03)<<4) + (reg0x350b>>4);

#### 4.10.3 Dummy Lines and Dummy Pixels

If enable auto-night mode of OV5640, the dummy lines are automatic inserted. The number of dummy lines are controled by register {0x3a02[3:0], 0x3a03} for 60Hz and {0x3a14[3:0], 0x3a15} for 50Hz.

Dummy pixels are used to adjust timing. Please adjust HTS register {0x380c, 0x380d} to insert dummy pixels.

#### 4.10.4 Capture Sequence

##### 4.10.4.1 Auto Focus

Trigger single auto focus

Pause auto focus (hold lens at focused position)

##### 4.10.4.2 Read Preview Registers

Read preview\_shutter

Read preview\_gain

Read previewHTS

Read preview\_sysclk

Read preview\_bining\_factor B

##### 4.10.4.3 Change Resolution to Capture

Download Capture setting. Turn off AGC/AEC.

##### 4.10.4.4 Read Capture Register Values

Read capture\_HTS

Read capture\_VTS

Read capture\_banding\_filter

Read capture\_SYSCLK

#### 4.10.4.5 Preview Gain/Exposure to Capture/Gain Exposure

The shutter of capture should have same time as preview.

$$\text{capture\_shutter} = \text{preview\_shutter} \times \frac{\text{capture\_PCLK}}{\text{preview\_PCLK}} \times \frac{\text{preview\_HTS}}{\text{capture\_HTS}} \times B$$

$$\text{capture\_gain} = \text{preview\_gain}$$

Where B is binning factor. B=1 for OV5640.

Under strong light, when preview\_shutter = 1, after calculation capture\_shutter=0 due to error of integer calculation. To avoid such issue, we may calculate like this

$$\text{preview\_shutter} = \text{capture\_shutter}$$

$$\text{capture\_gain} = \text{preview\_gain} \times \frac{\text{capture\_PCLK}}{\text{preview\_PCLK}} \times \frac{\text{preview\_HTS}}{\text{capture\_HTS}} \times B$$

#### 4.10.4.6 Gain to Exposure and Capture Banding Filter

gain\_exposure = capture\_shutter\*capture\_gain;

```
If( gain_exposure < capture_banding_filter) {
    // capture_shutter < 1/100
    capture_shutter = gain_exposure;
    capture_gain = gain_exposure/capture_shutter;
}
else {
    if( gain_exposure > (capture_VTS-4)) {
        // exposure reach maximum
        capture_shutter = capture_VTS - 4;
        capture_gain = gain_exposure/capture_shutter;
    }
    else {
        // 1/100 < exposure < max, capture_shutter = N * capture_banding_filter
        capture_shutter = int(gain_exposure/capture_banding_filter) * capture_banding_filter;
        capture_gain = gain_exposure/capture_shutter;
    }
}
```

#### 4.10.4.7 Write gain/exposure value

Write capture\_gain

Write capture\_shutter

#### 4.10.4.8 Capture

Wait for 2 Vsync  
Capture the 3<sup>rd</sup> frame.

#### 4.10.4.9 Back to Preview

```
// release auto focus, release lens back to infinite.  
//Write Registers, Change to preview  
//Start AG/AE  
write_i2c(0x3503, 0);
```

### 4.11 Scale and Zoom

To use scale/zoom function, the ISP scale 0x5001[5] must be set to '1'. To make sure zoom/scale changes smoothly, I2c group write is highly recommended.

#### 4.11.1 Scale

OV5640 ISP support down scale. Images could be scaled down to any size less than 2592x1944. If the aspect ratio of output image is same as sensor image (4:3), adjust register DVPHO and DVPVO to get the desired image size. For example, to get 2048x1536 output

DVPHO = 2048

DVPVO = 1536

H offset = 16

Y offset = 4

```
write_i2c(0x3212, 0x03);      // start group 3  
write_i2c(0x3808, 0x08);      // DVPHO = 2048  
write_i2c(0x3809, 0x00);      // DVP HO  
write_i2c(0x380a, 0x06);      // DVPVO = 1536  
write_i2c(0x380b, 0x00);      // DVPVO  
write_i2c(0x3810, 0x00);      // H offset = 16  
write_i2c(0x3811, 0x10);      // H offset  
write_i2c(0x3812, 0x00);      // V offset = 4  
write_i2c(0x3813, 0x04);      // V offset  
write_i2c(0x3212, 0x13);      // end group 3  
write_i2c(0x3212, 0xa3);      // launch group 3
```

If the aspect ratio of output image is different as sensor image (not 4:3), then need to adjust X offset and Y offset to clip input image to same aspect ratio as output image. For example, to get 1280x1024 output

DVPHO = 1280

DVPVO = 1024

input image height = 1944

input image width =  $1944 * 1280 / 1024 = 2430$

X offset = 16

Y offset =  $4 + (2592 - 2430) / 2 = 85$

```
write_i2c(0x3212, 0x03);      // start group 3
write_i2c(0x3808, 0x05);      // DVPHO = 1280
write_i2c(0x3809, 0x00);      // DVP HO
write_i2c(0x380a, 0x04);      // DVPVO = 1024
write_i2c(0x380b, 0x00);      // DVPVO
write_i2c(0x3810, 0x00);      // H offset = 16
write_i2c(0x3811, 0x10);      // H offset
write_i2c(0x3812, 0x00);      // V offset = 85
write_i2c(0x3813, 0x55);      // V offset
write_i2c(0x3212, 0x13);      // end group 3
write_i2c(0x3212, 0xa3);      // launch group 3
```

#### 4.11.2 Digital Zoom

For any image output size less than 2592x1944, increase X offset and Y offset in such way that the aspect ratio of input image match with aspect ratio of output image, digital zoom function is implemented by this way. For example, when output image is 1600x1200

Digital Zoom 1x

DVPHO = 1600

DVPVO = 1200

X offset = 16

Y offset = 4

```
write_i2c(0x3212, 0x03);      // start group 3
write_i2c(0x3808, 0x06);      // DVPHO = 1600
write_i2c(0x3809, 0x40);      // DVP HO
write_i2c(0x380a, 0x04);      // DVPVO = 1200
write_i2c(0x380b, 0xb0);      // DVPVO
write_i2c(0x3810, 0x00);      // H offset = 16
write_i2c(0x3811, 0x10);      // H offset
write_i2c(0x3812, 0x00);      // V offset = 4
write_i2c(0x3813, 0x04);      // V offset
write_i2c(0x3212, 0x13);      // end group 3
write_i2c(0x3212, 0xa3);      // launch group 3
```

Digital Zoom 1.5x

DVPHO = 1600

DVPVO = 1200

input image width =  $2592 / 1.5 = 1728 > 1600$

input image height =  $1944 / 1.5 = 1296 > 1200$

$$X \text{ offset} = 16 + (2592 - 1728)/2 = 448$$

$$Y \text{ offset} = 4 + (1944 - 1296)/2 = 328$$

```
write_i2c(0x3212, 0x03);      // start group 3
write_i2c(0x3808, 0x06);      // DVPHO = 1600
write_i2c(0x3809, 0x40);      // DVP HO
write_i2c(0x380a, 0x04);      // DVPVO = 1200
write_i2c(0x380b, 0xb0);      // DVPVO
write_i2c(0x3810, 0x01);      // H offset = 448
write_i2c(0x3811, 0xc0);      // H offset
write_i2c(0x3812, 0x01);      // V offset = 328
write_i2c(0x3813, 0x48);      // V offset
write_i2c(0x3212, 0x13);      // end group 3
write_i2c(0x3212, 0xa3);      // launch group 3
```

## Revision History

Rev 2.01

Merge from “OV5640 Camera Module Software Application Notes” and “OV5640 Camera Module Hardware Application Notes”.

Rev 2.10

Add auto focus support.

Rev 2.11

Update contrast setting(as DB version A10/AM10).

Add 4.11 Scale.

Update demo driver. Move driver code from “Form1.h” to “PantherDemo.cpp”

R 2.12

Fixed capture exposure bug in driver code.

Add “write\_i2c(0x4005, 0x1a); // BLC always update” in initial setting.

Change from DVP interface to MIPI interface.

Update initial setting
